Drug design, often referred to as rational drug design or simply rational design, is the inventive process of finding new medications based on the knowledge of a biological target. The drug is most commonly an organic small molecule that activates or inhibits the function of a biomolecule such as a protein, which in turn results in a therapeutic benefit to the patient.

In many ways, the techniques of design thinking are well suited for the task of generating a capability model. In most of the situations I've been aware of, stakeholders for a capability model have never seen one before and have no idea how to use one. It's tough to assist in designing something that you've never used before.
