Digital coding of waveforms: Principles and applications

Pulse Code Modulation. PCM is a waveform coding method defined in the ITU-T G.711 specification. Filtering. The first step to convert the signal from analog to digital is to filter out the higher frequency component of the signal. This make things easier downstream to convert this signal.

Abstract: A study is presented on the digital coding of speech by means of a straightforward approximation of the time waveform. In particular, the closely related discrete-time discrete-amplitude signal representations that are rather well known as pulse-code modulation (PCM), differential pulse-code modulation (DPCM), and delta modulation (DM) are discussed.

Digital coding of speech waveforms: PCM, DPCM, and DM

Â§ If use natural binary code to code the reconstruction levels of a uniform quantizer with a uniformly distributed input source, then every increased bit in the coding brings out a 6.02 dB increase in the SNRms.

As Equivalently from Equation 2.7, whenever the step size of the uniform quantizer decreases by a half, the MSEq decreases four times.
